# TGS 4160 - for the detection of Carbon Dioxide

### **Features:**

- \* High selectivity to CO2
- \* Low dependency on humidity
- \* Long life

## **Applications**:

- \* Air quality control
- \* CO2 control in agricultural applications
- \* CO<sub>2</sub> monitoring

The **TGS4160** is a hybrid sensor unit composed of a carbon dioxide sensitive element and a thermistor. A wide range of 350~50,000ppm of carbon dioxide can be detected by TGS4160, making it ideal for usage in a variety of applications.

The CO<sub>2</sub> sensitive element consists of a solid electrolyte formed between two electrodes, together with a printed heater (Pt) substrate. By monitoring the change in electromotive force (EMF) generated between the two electrodes, it is possible to measure CO<sub>2</sub> gas concentration.

Adsorbent (zeolite) is filled between the internal cover and the outer cover for the purpose of reducing the influence of interference gases.

**TGS4160** exhibits a linear relationship between  $\Delta$ EMF and CO<sub>2</sub> gas concentration on a logarithmic scale. The sensor displays good long term stability and shows excellent durability against the effects of high humidity.

The figure below represents typical sensitivity characteristics of TGS4160. The Y-axis is indicated as  $\Delta$ EMF which is defined as follows:

ΔEMF=EMF1 - EMF2

where

EMF1=EMF in 350 ppm CO<sub>2</sub>

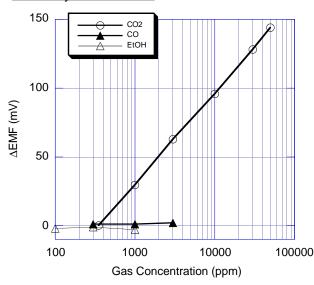

EMF2=EMF in listed gas concentration

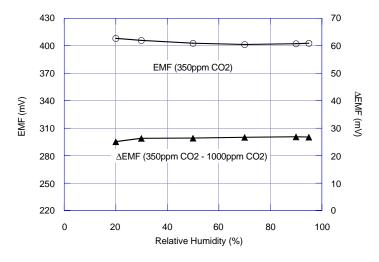

The figure below shows typical humidity dependency for an energized sensor. Again, the Y-axis is indicated as  $\Delta$ EMF which is defined as follows:

ΔEMF=EMF1 - EMF2
where
EMF1=EMF in 350 ppm CO<sub>2</sub>
EMF2=EMF in 1000ppm CO<sub>2</sub>

#### **Basic Measuring Circuit:**

The TGS4160 sensor requires heater voltage (VH) input. The heater voltage is applied to the integrated heater in order to maintain the sensing element at a specific temperature which is optimal for sensing. Electromotive force (EMF) of the sensor should be measured using a high impedance (>  $100\,\mathrm{G}\Omega$ ) operational amplifier with bias current <  $1\mathrm{pA}$  (e.g. Texas Instruments' model #TLC271). Since the solid electrolyte type sensor

functions as a kind of battery, the EMF value itself would drift using this basic measuring circuit. However, the change of EMF value ( $\Delta$ EMF) shows a stable relationship with the change of CO<sub>2</sub> concentration. Therefore, in order to obtain an accurate measurement of CO<sub>2</sub>, a special microprocessor for signal processing should be used with TGS4160. Figaro can provide a special evaluation sensor module (AM-4) for TGS4160.

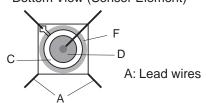

## **Specifications:**

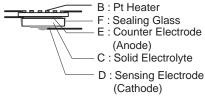

| Model number   |                                 |      | TGS 4160   |                                    |  |
